## Foreword

WITH THE enactment of the health insurance program for the aged (Medicare), it became possible for the first time to organize a continuing information system to report the use of health care services by older Americans. Since Medicare began one of the basic tasks has been to process and pay claims for covered medical services submitted by or on behalf of the more than 19 million persons entitled to hospital insurance benefits and the 17.7 million persons enrolled for supplementary medical insurance benefits. From this operation come data on the amount, the kind, and the cost of such services used by the aged.

This report is the first in a series of publications designed to disseminate such data on a regular basis. It provides detailed statistical information on discharges from short-stay hospitals for persons insured under Medicare. Reports on the number and characteristics of participating providers, and of persons enrolled under Medicare have been issued earlier in this series. The reports are intended to give a comprehensive account of the amounts reimbursed under the program, the kinds of services paid for, and the variations in utilization and reimbursement by age, race, and sex of the beneficiary, as well as his place of geographic residence. Such data can provide new insights into the patterns of medical

care for persons aged 65 and over. A fuller understanding of present practice can contribute to improved health services not only for the aged but for the general population as well.

Many individuals in the Social Security Administration have assisted with the development of this series. The preparation of these reports is a major function of the ORS Division of Health Insurance Studies, under the supervision of Howard West, director, and Aaron Krute, deputy director, and involving a majority of its staff. Important contributions for the tabulation and presentation of the statistical content of this report were made by Irving Goldstein, Willard P. Hess, Robert J. Butler, and Theodosia P. Rasberry of the Statistical Processing and Procedures Branch of that division. Text preparation was the responsibility of George S. Chulis of the Program Statistics Branch. Special acknowledgment for computer services are made to the Division of Health Insurance Statistical Data, Bureau of Data Processing.

The general tables were produced by the "System for Automated Tabular Composition," a computer system, at the Social Security Administration headquarters in Baltimore, Maryland. They were set on Linotron equipment at the Government Printing Office in Washington, D.C.

4.1.9 Discharges by type of hospital control and bed size: percentage distribution of length of stay for patients with surgery and without surgery . . . . .	4.1-29
4.1.10 Discharges by age, race, and sex: mean and median length of stay, by type of hospital control for patients with surgery and without surgery . . . . .	4.1-32
4.1.11 Discharges by type of training program, JCAH accreditation, and bed size of hospital: length of stay for patients with surgery and without surgery . . . . .	4.1-35
4.1.12 Discharges by type of training program, JCAH accreditation, and bed size of hospital: percentage distribution of length of stay for patients with surgery and without surgery . . . . .	4.1-37
4.1.13 Persons discharged by age, race, sex, and final discharge status: number of hospital stays, utilization, charges, and reimbursement . . . . .	4.1-39
4.1.14 Persons discharged by age, race, and sex: number of hospital stays and nonreimbursable charges . . . . .	4.1-42
4.1.15 Discharges by month: month of admission, total stay, total and daily usage rates, and length of stay for patients with surgery and without surgery . . . . .	4.1-46
4.1.16 Discharges by population size groups of SMSA's and for each area of 500,000 population or more in 1960: utilization, charges, and reimbursement for patients with surgery and without surgery . . . . .	4.1-47

# The Statistical System

THIS PUBLICATION is a section of a statistical report series produced from Medicare program records. Presented on a calendar year basis, describing services rendered in the year, the series includes sections on enrollment, characteristics of providers, inpatient hospital care, outpatient hospital services, home health services, physicians' and other medical services, and overall summaries.

The primary objective of these reports is to provide data required to measure and evaluate program operation and effectiveness. Benefit payment operations furnish information about the amount and kind of hospital and medical care services used by persons aged 65 and over, as well as the expenditures for such services. The applications by hospitals, extended care facilities, home health agencies, and independent laboratories to participate in the program provide data on the characteristics of such providers of services. The claim number assigned to each individual serves as the link between the program services utilized and the demographic characteristics of each individual recorded in the health insurance entitlement master file.

The data-collection system has two inherent characteristics that determine the scope, detail, and flexibility of the available data. First, data are collected and maintained on an individual basis so that the beneficiary and his medical experience under the program form the basic unit. Second, records for each bill paid under the program and, for a sample of beneficiaries, records of diagnoses and surgical procedures are maintained on a centralized basis. Except for intermediary operating statistics such as those relating to workloads, costs, and the like, all program statistics are centrally prepared.

## THE BASIC RECORDS

The statistical system is based on five related computer-tape records: the health insurance entitlement master file, provider record, hospital insurance (part A) utilization record, medical insurance (part B) payment record, and the record containing information from medical insurance bills for a 5-percent sample of supplementary medical insurance enrollees.

## THE HEALTH INSURANCE ENTITLEMENT MASTER FILE

The health insurance entitlement master file identifies each aged person eligible for health insurance benefits and indicates whether he is entitled to hospital benefits, to supplementary medical insurance benefits, or to both of these benefits.

This record is used to create a health insurance card that is sent to each insured person. The card contains the individual's claim number (the number used for OASDI or railroad retirement programs). It indicates the entitlement of the individual for the two parts of the Medicare program.

The entitlement record provides the population data for each part of the program and therefore serves as the base for the computation of a variety of utilization rates, limited only by its demographic content.

## PROVIDER RECORD

Every hospital, home health agency, extended care facility, and independent laboratory must apply for participation in the hospital insurance program in order to be reimbursed for services provided. Data included on the application forms have been recorded in the central provider record and are updated as facilities are recertified periodically, as new ones apply for participation, or as some leave the program. When the information in this provider file is combined with utilization data, it serves to relate the characteristics of facilities and agencies that provide care to the kinds and amounts of service used by persons insured under Medicare.

## UTILIZATION RECORD FOR HOSPITAL INSURANCE

The administration of the hospital insurance program requires that two items of information be known about each person at the time of his admission to a hospital—his entitlement under the program and the extent to which he has used the benefits available to him under the "benefit period" concept.

When the patient is admitted to a hospital, the admission section of the inpatient hospital admission and billing form is completed by the hospital and forwarded through its intermediary to the Social Security Administration for recording in the central record. As soon as the record is checked, normally in less than 24 hours, the intermediary is informed of the patient's benefit status and of the number of days remaining during the "benefit period."

This information is then forwarded to the hospital. At discharge, the hospital completes the billing section of the form and sends it to the intermediary for payment. When approval for payment has been made, the intermediary forwards the claim to the Social Security Administration for inclusion in the central record.

As part of this process, information on diagnoses and surgical procedures are coded for a 20-percent

# of the Medicare Program

sample of beneficiaries based on specific combinations of digits in the health insurance claim number. Copies of admission and billing forms are handled in a comparable manner by home health agencies and extended care facilities. The outpatient billing form is also transmitted to the Social Security Administration for recording in the central record after the bill is approved for payment by the intermediary.

All the information on utilization experience in hospital and extended care facilities that is needed to administer the "benefit period" provision is recorded in the central record. This information includes stays in certain nonparticipating institutions that meet the definition of a hospital or extended care facility under the law, and days of care not covered or reimbursable under the program.

Each admission and billing form contains both the beneficiary's claim number and the provider's identification number. The resulting tape record can be readily matched to the beneficiary files and the provider files. By this process, a statistical tape record is created for the sample of insured persons that contains all the available information needed for tabulation from the three files related to Part A utilization.

## PAYMENT FOR MEDICAL INSURANCE

Payment or reimbursement under the SMI program is made only after receipt by the carriers (intermediaries involved in Part B of the Medicare program) of bills having allowed charges exceeding \$50 during a calendar year period.

For the insured population, carriers need to know from a central source that the deductible has been met; thereafter, during the remainder of the calendar year, the only additional information required from the Social Security Administration for reimbursement or payment purposes is whether the person is still enrolled under the SMI program.

For administration and operation of the program, the Social Security Administration must have accurate and complete information on the amounts paid by the carriers for physician services and for other services and supplies under this part of the program. To meet these needs, carriers furnish a payment record consisting of tape, punched card, or other machine-readable record of each bill paid. A "bill" is defined as a request for payment from or on behalf of a beneficiary as the result of services provided by a single physician or supplier.

The payment record also contains selected items of information needed to supply an efficient basis for drawing samples of the bills. These items provide a

sampling frame that may be used to draw additional samples designed to obtain specific information not furnished reliably by the basic sample of enrolled persons under the medical insurance program.

## THE MEDICAL INSURANCE SAMPLE

Although the payment record provides a rapid method for summarizing payment data and a sampling frame for efficiently drawing additional samples of bills, it does not provide specific data on diagnoses, procedures, and related charges.

Basic statistics on the utilization of physician and other services covered under the supplementary medical insurance program are derived from bills paid by intermediaries to or on behalf of a continuous 5-percent sample of all enrolled persons. Intermediaries have been given specific combinations of digits of the health insurance claim number to be used in selecting the 5-percent sample, which is a sub-sample of the 20-percent sample used for hospital insurance program data.

Bills are submitted either directly on an SSA request for payment form, or on the SSA form in combination with the physician's billing form. Both methods are designed to provide information on the date and place of each service, the procedure carried out or service provided, the condition treated (diagnosis), and the physician's or supplier's charge for the specific service.

All of the bills of persons in the 5-percent sample to or for whom payment is made under the program, including those used to meet the annual \$50 deductible, are included in the sample and coded. However, data are not available through these procedures for persons in the sample who do not meet the \$50 deductible. Such data are collected by means of the Current Medicare Survey, with data made available in a separate report series.<sup>1</sup>

For hospital-based physicians who have authorized the provider to collect the fee for their services, the provider billing for patient services by physicians form is used. This form is completed for each patient. It includes descriptive information on the date and place of each service, the diagnoses, procedures, and the charges. These bills are received centrally for the 5-percent sample of persons enrolled for supplementary medical insurance.

## Short-Stay Hospital Utilization 1966

### Summary

THE HOSPITAL INSURANCE (HI) part of the Medicare program, effective July 1, 1966, provides payment for a large part of hospital costs for the population aged 65 and over. This report describes the frequency of, and charges for, short-stay hospital use in the first 6 months of the Medicare program by characteristics of the beneficiary, characteristics of the hospital, and selected variables relating to the hospital stay. A subsequent report will describe utilization for specific discharge diagnoses and selected surgical procedures. A brief summary of the major observations extracted from these tables follows.

During July-December 1966 there were over 2.3 million discharges from short-stay hospitals for persons 65 years and older insured under the hospital insurance (HI) part of Medicare.

The 2.3 million discharges represented the experience of about 1.9 million individuals, some of whom had more than one stay in a short-stay hospital during July-December 1966: about 80 percent were in hospitals once during the 6-month period, 16 percent were hospitalized twice, and 5 percent 3 times or more. In approximately 9 of every 10 episodes of hospitalization, the patient was discharged alive.

These discharges used 31.1 million days of hospital care; charges for nearly 93 percent, or 28.8 million of these days, were paid for in full or in part by HI reimbursement. On the date the program began, July 1, 1966, some persons 65 years and over were already in hospitals; they represented 5 percent of the discharges in the first 6 months of the program. With days of care prior to July 1 included for all discharges between July-December 1966, the mean length of stay was 13.2 days and the median 9.7. The annual rates of utilization during this period were 243 discharges and 3,220 days of care per 1,000 persons enrolled. These figures were obtained by doubling the observed 6-month rate, which does not adjust for seasonality in use of hospitals.

Surgery was performed during hospitalization for over 760,000 or 33 percent of all discharges.<sup>1</sup> These discharges accounted for 10.9 million days of care, or 35 percent of the total. The mean length of stay for this group was 14.2 days, while for discharges without surgery, it was 12.8 days.

Total hospital charges for discharges between July and December 1966 were \$1.3 billion or, on the average, \$42 per day, and \$559 per discharge. Of this amount, 79 percent was reimbursed under the HI program. Charges were higher for discharges with surgical treatment during hospitalization—averaging \$51 per day and \$718 per discharge. For discharges without surgery, the average charge was \$38 per day, and \$482 per discharge.

On the average, each person with one or more short-stay hospital discharges in 1966 under Medicare was responsible for \$66 in nonreimbursable charges. This figure ranged from an average of \$56 for persons with one discharge to an average of \$129 for persons with three or more discharges.

Hospital utilization and length of stay increased sharply with advancing age. Utilization rates rose from 190 discharges and 2,279 days of care per 1,000 enrollees aged 65-66 to 332 discharges and 5,071 days of care per 1,000 enrollees aged 85 and older. The average length of hospital stay increased from 12.0 days for persons 65-66 years to 15.3 days for persons 85 or older.

There were differences in the patterns of hospitalization between men and women. Women averaged longer hospital stays (13.7 days) than men (12.8 days). However, men used services at a greater rate than women. For men, the annual rates were 264 discharges and 3,366 days of care per 1,000 enrolled compared to 228 discharges and 3,113 days of care per 1,000 enrolled for women.

<sup>1</sup> Operative procedures defined as surgery in *Current Procedural Terminology*, First Edition, published by the American Medical Association in 1966 include procedures, involving incision, excision, amputation, introduction, endoscopy, repair, destruction, suture, or manipulation.

Persons of other races than white averaged longer hospital stays (14.1 days) than white persons (13.1 days), but discharge rates were considerably higher among white persons than for persons of other races. The annual discharge rates were 250 discharges per 1,000 enrolled white persons and 167 discharges per 1,000 enrollees of other races. A corresponding disparity existed for days of care wherein white persons used short-stay hospital care at an annual rate of 3,274 days per 1,000 persons enrolled compared to 2,346 days for persons of other races.

There were wide geographic differences in short-stay hospital utilization in the United States. Among the nine United States divisions, the annual discharge rate varied from a high of 297 per 1,000 enrolled in the West North Central and Mountain divisions to a low of 214 per 1,000 enrolled in the Middle Atlantic. A similar wide variation occurred in utilization of days of care where the high was 3,897 days per 1,000 enrollees in the West North Central and the low was 2,679 days per 1,000 enrollees in the Pacific division. The mean length of hospital stay ranged between a high of 15.9 days in the Middle Atlantic and a low of 10.6 days in the West South Central division. There were also wide variations geographically in hospital charges per day and per discharge.

Mean length of stay increased steadily as hospital size increased from 10.6 days for discharges in hospitals with less than 25 beds to 17.9 days for hospitals with 1,000-1,999 beds. The distribution of Medicare discharges among voluntary, proprietary, and State and local government hospitals was roughly proportionate to the number of beds available under each type of hospital control.

## Source and Qualifications

### of the Data

The data in this report were derived from bills for inpatient services submitted for Medicare payment by short-stay hospitals for a 20-percent sample of the insured population. When a beneficiary is admitted to a hospital, the hospital sends a notice of admission which is ultimately recorded in Social Security Administration files. Similarly, the hospital bills are also recorded in these files. Upon receipt of a discharge bill, a discharge record is created consolidating information about the hospitalization. The discharge record can consist of one or more bills depending on the length of stay and hospital billing procedures.

Information from the billing forms is matched to the master "Provider of Services" file maintained by the Social Security Administration. This file contains detailed information about the characteristics of each

short-stay hospital participating under Medicare. The bill data are also matched to the "Health Insurance Eligibility" file, which identifies all persons eligible for Medicare benefits and includes demographic information about each person. The final set of records, consisting of bill data, characteristics of the hospital, and demographic information about the person hospitalized is then used in the preparation of tabulations included in this report.<sup>2</sup>

The 20-percent sample on which the data in this report are based includes bills for all persons whose HI claim number ends in certain preselected numerical digits. The published data are inflated estimates derived from the sample counts. The estimates are prepared using a ratio-estimation weighting technique that is described in detail in "Reliability of Estimates" shown elsewhere in this report.

There is a lag between the time a person is discharged from a hospital and the time this discharge is posted to Social Security Administration records. The processing time for most discharges is comparatively short. However, the time lag increases for claims involving special problems. The data in this report include all discharges from short-stay hospitals in July-December 1966 that were received and recorded as of January 3, 1969. An estimate made 18 months after this date, in July 1970, indicated that over 98 percent of the 1966 short-stay hospital discharges were included in the publication file.

Reimbursement to hospitals under hospital insurance is based on the reasonable cost of furnishing services. The final amount of reimbursement due under Medicare is established through an audit of a cost statement submitted by the hospital. The reimbursement amounts shown in these tables are based on interim reimbursement rates established to reflect costs as closely as possible. Most short-stay hospitals were reimbursed using formulas which estimated average per diem costs for room and board and ancillary services. Preliminary information from audited cost reports for 1966 indicates that final reimbursements are about 5 percent higher than the amounts paid on an interim basis.<sup>3</sup>

Changes in the residence of beneficiaries are recorded as they are reported in health insurance eligibility files. The State of residence for each discharge reflects the residence information in the eligibility file at the time the hospital discharge record was matched to it.

<sup>2</sup> For more detailed information about bill records and files see "The Statistical System of the Medicare Program" on page vi of this report.

<sup>3</sup> See Robert J. Myers, "Hospitalization and Average Daily Hospital Costs for Persons Aged 65 and Over as Indicated by Data under the Hospital Insurance Program and from the American Hospital Association," *Actuarial Note No. 70*, U.S. Social Security Administration, Washington, D.C., April 1970.

Days of care figures relate to hospitalizations with a discharge in the last half of 1966. These figures probably slightly underestimate total 1966 days of care paid for by Medicare for this period because they exclude days of persons admitted in 1966, but discharged after the end of the calendar year. Days of care before July 1, 1966, are included in total days of care but excluded as covered days of care.

Also with respect to days of care, it was necessary to partially estimate the number of days in hospital *prior to* July 1, 1966 because of a misunderstanding about reporting. Instructions called for hospitals to enter onto billing forms the *actual* date of admission for eligible persons already in the hospital on July 1, 1966. However, an examination of bills indicated that July 1, 1966, the date coverage started, rather than the *actual* date of admission was entered with unexpected frequency, resulting in an underestimation of days of care prior to July 1. Consequently, a systematic procedure was developed to estimate admission dates for these bills based on available information about the distribution of length of stay among persons 65 years and over.

## Number and Rate of Discharges

It should be noted that the period covered by this report, July-December 1966, was a time of pervasive change of the pre-Medicare pattern of short-stay hospital utilization by persons aged 65 and over. The Medicare program provided comprehensive hospital coverage to a segment of the population that had been largely without hospital insurance. The National Center for Health Statistics estimated that just over half of the population aged 65 and older were covered by some form of hospital insurance during the year July 1962-June 1963.<sup>4</sup> A survey conducted by the Social Security Administration in December 1962 of a sample of aged persons was in close agreement. It found that 51 percent of persons 65 and over had hospital insurance.<sup>5</sup> It should be noted that the benefits available under the hospital insurance policies possessed by most aged persons at that time were not as extensive as those provided under Medicare. For example, another study based on the Social Security Administration survey found that about half the aged patients who had been hospitalized in 1962 were responsible for payment of 25 percent or more of their total hospital bills after

insurance payment had been made.<sup>6</sup> With the advent of Medicare, virtually all persons 65 and over acquired hospital insurance.<sup>7</sup> A recent study gathered data from a number of sources to evaluate both the initial impact and the effects of Medicare during its first 5 years on hospital use by the aged.<sup>8</sup> This report clearly shows a significant increase in hospital use by persons aged 65 and over with the advent of the Medicare program on July 1, 1966. It was the starting point for an upward surge in hospital utilization by the elderly which continued until 1969. Hospital utilization by older persons leveled off at that point but not before a significant alteration in the balance of hospital usage between the aged and the remainder of the population had occurred.<sup>9</sup> A report from the Hospital Discharge Survey estimated that between 1965 and 1967, the short-stay hospital discharge rate increased 10 percent, mean length of stay increased from 13.0 to 14.1 days, and the days of care utilization rate increased 19 percent for persons 65 years and older.<sup>10</sup>

There were over 2.3 million discharges to persons with Medicare coverage during July-December 1966, the first 6 months of the program, giving an annual rate of 243 discharges per 1,000 enrolled (HI) persons. Surgery was performed for over 760,000, or roughly 1 in every 3 discharges.

Approximately 1 of every 10 Medicare hospitalizations, including over 240,000 discharges, ended with the death of the patient. Over 5 percent, or 126,000, of the July-December 1966 discharges were for persons admitted to short-stay hospitals prior to the start of the program on July 1, 1966.

Data from the Current Medicare Survey indicates that a total of 180,000 Medicare beneficiaries were in hospitals of all types, i.e., short-stay, psychiatric and other long-stay on July 1 when the program began.<sup>11</sup> This survey estimates hospital utilization based on a 0.5 percent sample of admission notices received by the Social Security Administration.

<sup>9</sup> See Sara Jane Godshall, *Current Medicare Survey Report 10, Hospital Insurance Sample*, U.S. Social Security Administration, Office of Research and Statistics, October 8, 1969.

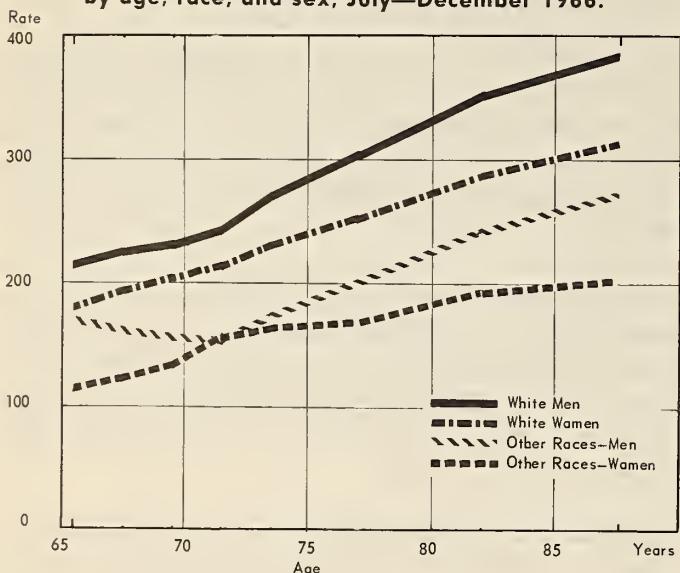

## Age, Race, Sex

The annual rate of discharges increased markedly with advancing age, from 190 discharges per 1,000 enrolled at aged 65-66 to 332 discharges per 1,000 enrollees aged 85 and over (table A). Nearly 1.1 million discharges were recorded for men compared to just under 1.3 million for women. However, short-stay hospital discharge rates were 16 percent higher on the average for men than for women during this period. The average annual rate for men was 264 discharges per 1,000 enrollees and for women, 228 per 1,000. Rates were consistently higher for men at every age (table A and figure 1).

White persons accounted for over 2.1 million or 92 percent of all short-stay discharges (table 4.1.2), and

persons of all other races for 122,000 discharges, representing 5 percent of the total. The remaining 3 percent were discharges of persons whose race was unknown. An earlier report of Medicare utilization in 1966 suggested that most persons whose race is unknown are probably white since their pattern of utilization as a group closely resembles that of white persons.<sup>1,2</sup> Discharge rates for short-stay hospitals were substantially greater for white persons (250 per 1,000 enrollees) than for persons of all other races (167 per 1,000 enrollees) (table A). The differences in these rates between races were observed for both sexes. The annual discharge rates per 1,000 enrolled persons for white men (271) and women (233) were 47 percent and 53 percent higher, respectively, than the rates for men (184) and women (152) of other races. Higher discharge rates from short-stay hospitals for whites occurred at every age for both men and women, but different patterns emerged between the sexes. These patterns are illustrated by the following data derived from Table A.

**Figure 1. Annual rate of short-stay hospital discharges per 1000 enrolled persons by age, race, and sex, July—December 1966.**

Age	Ratio of rate for white persons to rate for persons of other races	
	Men	Women
65 years and over.....	1.47	1.53
65-66.....	1.27	1.53

<sup>1</sup> Includes persons of unknown race.

<sup>2</sup> Rate for women used as denominator.

For men, the ratio of discharge rates between whites and other races increased steadily from 1.27 for men aged 65-66 to 1.60 at ages 73-74. After age 74 the gap in discharge rates narrows to 1.42 for men aged 85 or more. In contrast, except for age group 71-72 (1.41), the ratio of discharge rates for white women and women of other races remains in a narrow range between 1.48 and 1.56 in each age category.

A greater proportion of discharges for men (35 percent) than women (31 percent) involved surgical treatment (table 4.1.2). Similarly, proportionately more white persons (33 percent) than persons of other races (31 percent) experienced surgically treated discharges. By age, the highest percentage of discharges with surgery, 38 percent, occurred at ages 65-66. The percentage of discharges with surgery declined steadily with advancing age to a low point of 23 percent at ages 85 and over.

#### Geographic Distribution

Among the four regions of the United States, the discharge rate was highest in the North Central States, 262 discharges per 1,000 enrolled persons (table 4.1.1) and lowest in the Northeast (217). It should be noted that geographic differences reflect, to some extent, the uneven distributions of hospital beds and of enrolled persons by age, race, and sex throughout the country. For example, over 60 percent of persons of other races enrolled for hospital insurance under Medicare in 1966 resided in the South.<sup>13</sup> Similarly, an earlier report on participating hospitals noted wide geographic differences in available beds.<sup>14</sup>

Geographic division	Number of discharges (in thousands)	Annual rate of discharges per 1,000 enrolled persons under hospital insurance
All areas . . . . .	2,350	243
United States . . . . .	2,339	246
Northeast . . . . .	551	217
New England . . . . .	141	225
Middle Atlantic . . . . .	410	214
North Central . . . . .	735	262
East North Central . . . . .	455	244
West North Central . . . . .	279	297
South . . . . .	702	256
South Atlantic . . . . .	307	238
East South Central . . . . .	147	243
West South Central . . . . .	248	294
West . . . . .	351	246
Mountain . . . . .	94	297
Pacific . . . . .	257	232

<sup>13</sup> U.S. Social Security Administration, Office of Research and Statistics, *Medicare: Health Insurance for the Aged, 1966, Section 2: Persons Enrolled in the Health Insurance Program* (Washington, D.C.: U.S. Government Printing Office, 1969).

<sup>14</sup> U.S. Social Security Administration, Office of Research and Statistics, *Medicare: Health Insurance for the Aged, 1966, Section 3.1: Participating Hospitals* (Washington, D.C.: U.S. Government Printing Office, 1970).

Among the nine United States divisions, the rate of 297 discharges per 1,000 enrolled persons in the Mountain division matched the West North Central rate as the highest in the United States. The lowest rate, 214 discharges per 1,000 enrolled, occurred in the Middle Atlantic division.

#### Hospital Characteristics

Most participating short-stay hospital beds are in voluntary hospitals. Discharges for persons aged 65 and over are roughly proportionate to the distribution of adult beds by hospital control, as shown below:

Type of hospital control	Discharges		Adult beds <sup>1</sup>	
	Number (in thousands)	Percent	Number	Percent
All hospitals . . .	2,350	100.0	756,931	100.0
Voluntary . . . . .	1,692	72.0	512,488	67.7
Church . . . . .	654	27.8	—	—
Other. . . . .	1,038	44.2	—	—
Government . . . . .	480	20.4	193,865	25.6
Proprietary . . . . .	178	7.6	50,578	6.7

<sup>1</sup> Number of beds by type of control based on unpublished SSA data as of July 1967, the earliest period for which data were tabulated.

Voluntary hospitals account for a slightly greater proportion of discharges than of adult beds, while government hospitals had a larger percentage of beds than discharges.

On the average, of every ten Medicare short-stay discharges, seven were from hospitals with less than 300 beds, two were from hospitals with 300-499 beds, and one was from a hospital with 500 or more beds. Compared to the distribution of beds, small hospitals (less than 100 beds) accounted for more, and large hospitals (500 or more beds) accounted for less than their proportionate shares of Medicare discharges.

Hospital bed size	Discharges		Adult beds <sup>1</sup>	
	Number	Percent	Number	Percent
All hospitals . . .	2,350	100.0	756,931	100.0
Less than 100 beds . . .	684	29.0	177,345	23.4
100-299 . . . . .	980	41.7	302,802	40.0
300-499 . . . . .	444	18.9	151,767	20.1
500 beds or more . . . . .	242	10.4	125,017	16.5

<sup>1</sup> Number of beds by bed-size based on unpublished SSA data as of July 1967, the earliest period for which data were tabulated.

## Days of Care

The 2.3 million discharges from short-stay hospitals in July-December 1966 used 31.1 million days of care for an annual rate of 3,220 days of care per 1,000 enrolled persons. Nearly 93 percent, or 28.8 million days, were covered in whole or in part by reimbursement under the hospital insurance program. During July-December 1966, Medicare covered up to 90 days of hospitalization in a benefit period. A benefit period began on the first day a person was admitted to a hospital and ended with the first period of 60 consecutive days that he was not an inpatient in a hospital or extended care facility. Noncovered hospital days were days before July 1, 1966, or days after benefits had been exhausted, or days after a patient's illness had progressed to the point where full inpatient hospital services were no longer necessary. The part of the Medicare law that provided post-hospitalization extended care benefits did not go into effect until January 1, 1967.

Discharges with surgical treatment accounted for 10.9 million, or 35 percent, of all days of care and nonsurgical hospital stays for the balance, 65 percent or 20.2 million days.

### Age, Race, Sex

As with discharges, the annual rate of use of days of care showed a strong upward trend with age. It increased steadily from a rate of 2,279 days of care per

1,000 enrollees aged 65-66 to 5,071 days of care per 1,000 enrollees at ages 85 and over (table B).

The difference between annual rates for days hospitalized for men and women was greatest (19 percent) at ages 65-66. This difference by sex then diminished steadily to a low point of 5 percent at ages 71-72, after which the differences in rates by sex stabilized at 10 to 12 percent. In all cases rates for men were higher.

The use of short-stay hospital days of care by race followed almost the same pattern as utilization measured by discharges. Whites used 91 percent of all days of care, persons of other races accounted for 6 percent, and the remaining 3 percent were used by persons for whom race was not reported. The annual rates of days of care per 1,000 persons enrolled averaged 40 percent higher for white persons than for persons of other races. White men used days of care at a rate of 31 percent higher than the rate for men of other races. Among women, the difference in rates was even greater with a 49 percent higher rate for white women than women of other races.

Among persons of other races, the pattern of differences between annual utilization rates by sex was very pronounced (table B). The wide differences in rates observed at ages 65-66 (53 percent) diminished to a minimum at ages 71-72 (4 percent). At ages 73-74 and beyond the differences increased with advancing age. There are two distinct patterns apparent for the population of persons of other races. Between ages 65-72, the rates for days of care for women increased at a faster rate than for men. After age 72, the rates for men increased at a faster rate than the corresponding rates for women. This pattern is illustrated in figure 2.

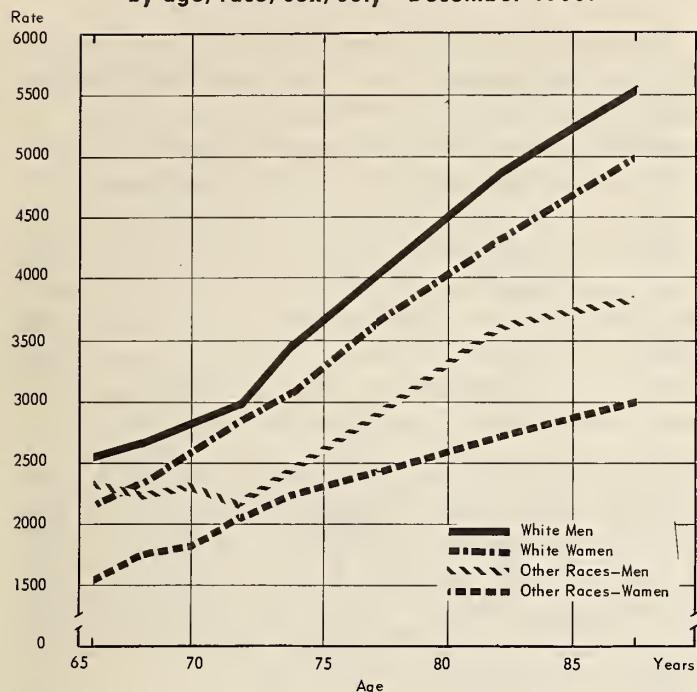

*Table B—Annual rate of short-stay hospital days of care per 1,000 enrolled persons under hospital insurance, by age, race, and sex, July-December 1966*

<sup>1</sup> Includes persons of unknown race.

<sup>2</sup> Rate for women used as denominator.

**Figure 2. Annual rate of short-stay hospital days of care per 1000 enrolled persons by age, race, sex, July—December 1966.**

Days of care involving surgery were distributed differently by sex; over 38 percent of days for men were for discharges with surgical treatment compared to 33 percent for women. For both white persons and persons of other races, 35 percent of days of care used were for discharges with surgery. By age, a similar pattern to that noted for discharges was observed for days of care. The percentage of days of care for surgically treated discharges was highest at ages 65-66 (40 percent) and declined steadily to ages 85 and over (27 percent).

Age, sex, and race	Percent days of care for discharges with surgery	Percent days of care for discharges without surgery
All persons, 65 years and over . . . . .	35.0	65.0
65-66. . . . .	40.0	60.0
67-68. . . . .	39.7	60.4

71-72. . . . .	37.7	62.3
73-74. . . . .	36.4	63.6
75-79. . . . .	34.0	66.0
80-84. . . . .	30.5	69.5
85 and over. . . . .	27.1	72.9
Men . . . . .	38.2	61.8
Women . . . . .	32.5	67.5
White. . . . .	35.1	64.9
Other races . . . . .	35.4	64.6

## Geographic Distribution

The geographic distribution of days of care per 1,000 persons enrolled is similar to the pattern shown previously for discharges. As with discharges, the North Central region showed the highest rate of days of care used, 3,607 per 1,000 enrollees. The West showed the lowest rate of utilization, 2,860 days per 1,000 enrolled, replacing the Northeast which showed the lowest discharge rate. This shift in the relative position of the two regions reflects the much lower length of stay in the West (see table F). Among United States divisions the highest utilization rate occurred in the West North Central area (3,897 days per 1,000 enrollees) and the lowest rate occurred in the Pacific division (2,679 days):

Geographic division	Number of days of care (in thousands)	Annual rate of days of care per 1,000 enrolled persons
All areas . . . . .	31,112	3,220
United States . . . . .	30,961	3,256
Northeast . . . . .	8,528	3,360
New England . . . . .	2,010	3,223
Middle Atlantic . . . . .	6,518	3,404
North Central . . . . .	10,116	3,607
East North Central . . . . .	6,448	3,461
West North Central . . . . .	3,667	3,897
South. . . . .	8,236	3,005
South Atlantic. . . . .	3,883	3,008
East South Central . . . . .	1,716	2,840
West South Central . . . . .	2,638	3,119
West . . . . .	4,076	2,860
Mountain . . . . .	1,104	3,497
Pacific . . . . .	2,972	2,679

## Hospital Characteristics

The percentage distribution of days of care for persons aged 65 and over among hospitals according to type of control and adult bed-size is similar to the distribution shown for discharges (pages xi and xii). It follows therefore that the days of care distribution also approximates the distributions of beds as shown below:

Type of hospital control	Days of care		Adult beds <sup>1</sup>	
	Number (in thousands)	Percent	Number	Percent
All hospitals . . .	31,112	100.0	756,931	100.0
Voluntary . . . . .	22,769	73.2	512,488	67.7
Church . . . . .	8,589	27.6	—	—
Other. . . . .	14,180	45.6	—	—
Government . . . . .	6,291	20.2	193,865	25.6
Proprietary . . . . .	2,052	6.6	50,578	6.7

<sup>1</sup> Number of beds by type of control, based on unpublished SSA data as of July 1, 1967.

Proportionately, voluntary hospitals account for about 5 percent more days of care than adult beds, while government hospitals account for 5 percent less days of care than adult beds.

### Average Length of Stay

The mean length of hospital stay was 13.2 days for HI beneficiaries discharged from short-stay hospitals during July-December 1966 and the median for the same period was 9.7 days. Inpatient hospital days prior to the start of the program were included in the length of stay but were not covered by reimbursement under Medicare. These figures confirm earlier data obtained from a smaller nationwide sample of short-stay hospital discharges for all of 1966 for which the estimated mean length of stay was 13.4 days for persons aged 65 and older.<sup>15</sup> It is possible that the small difference arises from seasonal variation in patterns of hospital stays.

Data have also been published from the Current Medicare Survey which estimates covered rather than total days of care under Medicare. The Survey reported a mean of 12.4 covered days per discharge during July-December 1966.<sup>16</sup> This is virtually identical with the estimate of 12.3 covered days per discharge published in this report (table 4.1.1).

Length of hospitalization varies with the condition being treated and whether or not surgery is performed. Section 4.2 of the annual series will examine short-stay hospital utilization in terms of specific discharge diagnoses and surgical procedures while the present report distinguishes only discharges reported with and without surgery. Persons with surgery during hospitalization averaged 14.2 days of stay per discharge.<sup>17</sup> The mean for nonsurgical discharges was 12.8 days.

Surgical cases clearly represent a higher proportion of long-stay cases. This pattern is illustrated when discharges are grouped into weekly length of stay intervals (table D). Over 27 percent of the discharges with stays of 7 days or less involved surgery compared to nearly 40 percent of discharges for 36-42 days.

An earlier report presented preliminary data on the length of stay for short-stay discharges between July 1966-June 1967.<sup>18</sup> That report used the discharge ratio to examine the pattern of discharges by length of stay.

Bed size	Days of care		Adult beds <sup>1</sup>	
	Number (in thousands)	Percent	Number	Percent
All hospitals . . .	<sup>2</sup> 31,112	100.0	756,931	100.0
Less than 100 beds . . .	7,997	25.7	177,345	23.4
100-299 . . . . .	12,904	41.5	302,802	40.0
300-499 . . . . .	6,316	20.3	151,767	20.1
500 or more . . . . .	3,887	12.5	125,017	16.5

<sup>1</sup> Number of beds by type of control, based on unpublished SSA data as of July 1, 1967.

<sup>2</sup> Total includes 8,300 days of care for hospitals of unknown bed-size.

Hospitals with less than 100 beds accounted for slightly more days of care than their proportionate share of beds, while hospitals with 500 or more beds accounted for proportionately less days of care than adult beds.

### Monthly Utilization

The number of days of care, annual rate of days of care, and daily bed usage rates are shown for each month in the last half of 1966 in table C. Utilization generally increased from month to month during this period. The daily bed usage rate is a measure of hospital utilization that shows, on the average, the number of persons out of every 1,000 enrollees who are occupying hospital beds on any given day in the period. (See Notes for precise definition of rate.)

Table C.—Number and annual rate of short-stay hospital days of care and daily bed usage rate by month of discharge under hospital insurance, July-December 1966

Month of discharge in 1966	Days of care for discharges in month (in thousands)	Annual rate of days of care per 1,000 enrolled	Daily bed usage rate per 1,000 enrolled
Total . . . . .	31,112	3,220	8.8
July . . . . .	4,467	2,756	7.6
August . . . . .	5,170	3,185	8.7
September . . . . .	5,145	3,271	9.0
October . . . . .	5,460	3,355	9.2
November . . . . .	5,383	3,414	9.4

Table D.—Number and percent of short-stay hospital discharges under hospital insurance, by length of stay intervals and surgical status, July-December 1966

Length of stay in days	All discharges		With surgery		Without surgery	
	Number (in thousands)	Percent	Number (in thousands)	Percent	Number (in thousands)	Percent
Total . . . . .	2,350	100.0	767	32.6	1,583	67.4
7 days or less . . . . .	978	100.0	266	27.2	712	72.8
8-14 . . . . .	679	100.0	242	35.6	437	64.4
15-21 . . . . .	312	100.0	118	37.8	194	62.2
22-28. . . . .	157	100.0	60	38.2	98	61.8
29-35. . . . .	83	100.0	31	37.3	51	62.7
36-42. . . . .	48	100.0	19	39.6	29	60.4
43 or more . . . . .	92	100.0	31	33.7	61	66.3

The discharge ratio is defined as the ratio of the number of discharges on a specific day to the number not yet discharged and staying longer in the period described, and multiplied by 100. It measures the movement of hospital patients in relation to the length of stay. When the discharge ratios were computed and charted for the discharges in this report, similar results to those demonstrated in the earlier report occurred (figure 3). Assuming that the discharge ratio plotted by length of stay would be a smooth curve if determined by the nature of the illness alone, the peaks occurring at the seventh, fourteenth, twenty-first, and twenty-eighth day represent higher than expected numbers of discharges (figure 3). The data may reflect the practice adopted by many hospitals of reviewing hospitalized cases on a weekly basis. However, data from the Professional Activity Study of the Commission on Professional and

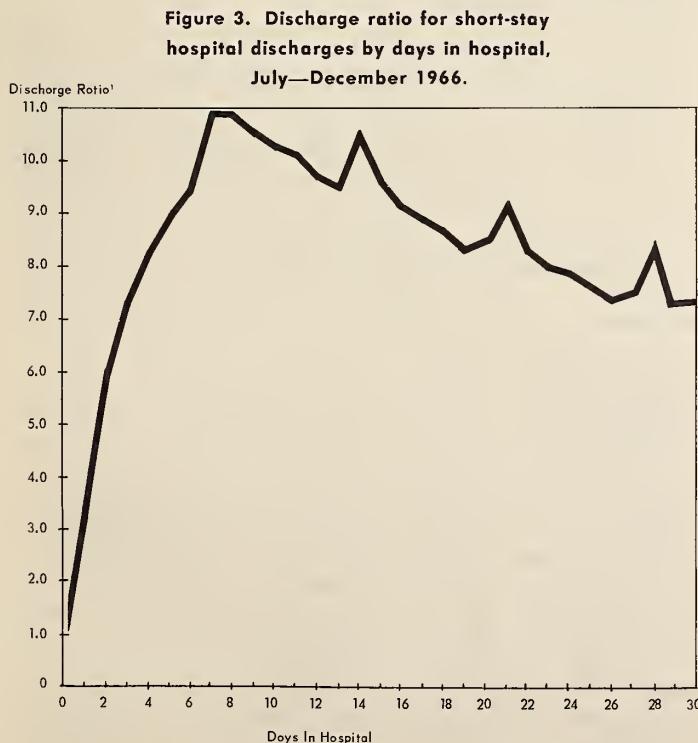

Hospital Activities indicates that the same pattern existed prior to Medicare. Thus the pattern exhibited by the data may represent some basic orientation by physicians and others to use hospitals in discrete time segments, i.e., in weekly terms.<sup>19</sup>

#### Age, Race, Sex

The mean and median length of hospital stay per discharge increased with age (table E). The mean rose from 12.0 days at ages 65-66 to 15.3 days for persons 85 and over. The increase in median length of stay was smaller, from 9.0 days at ages 65-66 to 10.5 days at ages 85 and over, suggesting that the increase in the mean arises from a large number of very long stays at older ages. The increase in mean length of stay with age was observed for discharges with and without surgery.

Women averaged nearly one day of hospitalization longer for each episode of hospitalization than men. Longer mean lengths of stay for women occurred at every age except at ages 65-66 where the stays were equal; the difference between lengths of stay by sex widened with advancing age. This pattern also applied to discharges with or without surgery.

Persons of all other races were hospitalized on the average a full day longer than white persons (Table E). The difference by sex was not observed for both race groups. White women averaged longer stays than white men, 13.5 days and 12.6 days, respectively; but for persons of other races, men averaged 14.2 days per discharge and women 13.9 days. The mean length of stay for men of other races remained fairly constant with increasing age. This is the only race/sex category that did not show a definite upward trend in length of stay with advancing age. It is also the smallest race/sex group comprising just over 3 percent of the population eligible for Medicare in 1966.<sup>20</sup> This group accounted

<sup>1</sup>Ratio of the number of discharges on a specific day to the number not yet discharged, multiplied by 100.

<sup>19</sup>Vergil N. Slee, M.D., and Raymond W. Cunningham, "Discharge Pattern for Patients 65 and Older: Pre- and Post-Medicare," *PAS Reporter*, Commission on Professional and Hospital Activities, Vol. 9, No. 2, January 25, 1971.

<sup>20</sup>See footnote 13.

85 and over.....	15.3	14.4	15.9	15.2	14.3	15.9	14.5	14.0	14.9

for just under 3 percent of all discharges. The mean length of stay for white women increased rather sharply from 11.9 days at ages 65-66 to 15.9 days at ages 85 and over. For women of other races the increase with age was much smaller, from 13.0 days at age 65-66 to 14.9 days at ages 80-84 (figure 4).

#### Geographic Distribution

Geographically, there were large variations in the length of stay for short-stay hospital discharges (table F). Among the nine United States divisions there was a difference of more than 5 days between the

average hospital stay for residents of the Middle Atlantic division, 15.9 days, and of the West South Central division, where the average stay was 10.6 days.

There is an interesting pattern relating to the length of stay for surgical and nonsurgical discharges within divisions (table F). For the Middle Atlantic and Pacific divisions there was only .3 of a day difference in mean length of stay for discharges with and without surgery. In contrast, surgical stays averaged nearly 2½ days longer than nonsurgical stays in the East South Central and West South Central divisions. Bringing the proportion of total discharges with surgery into the comparison, the two regions with virtually no difference in

Figure 4. Mean length of stay per discharge in short-stay hospitals by age, race, and sex, July—December 1966.

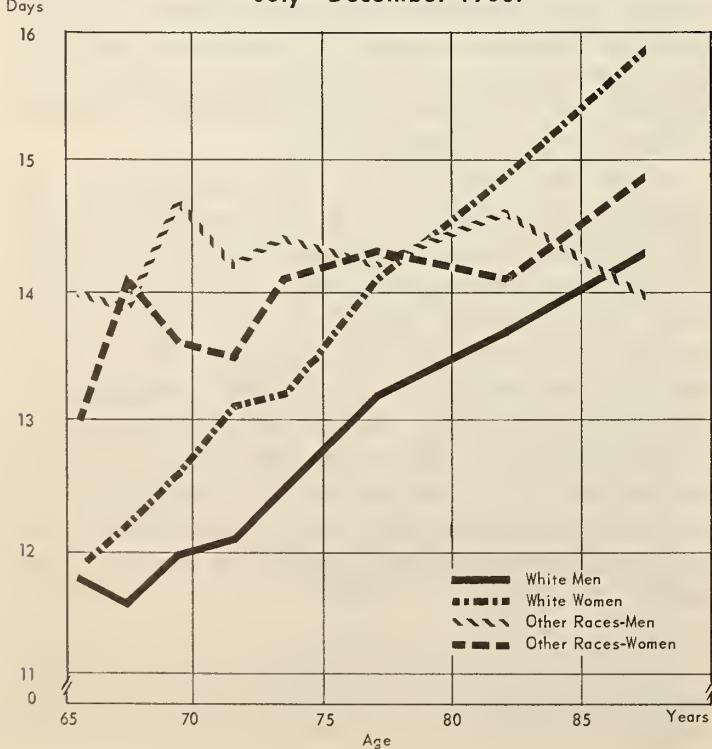

Table F—Mean length of stay and percentage of discharges requiring surgery for discharges from short-stay hospitals under hospital insurance, by divisions, July-December 1966

Geographic division	Mean length of stay in days				Percent of discharges treated surgically
	Total	With surgery	Without surgery	Difference	
All areas...	13.2	14.2	12.8	1.4	32.6
United States .	13.2	14.2	12.8	1.4	32.7

Mountain . .	11.8	12.3	11.5	.8	31.9
Pacific .....	11.6	11.7	11.4	.3	37.4

surgical and nonsurgical length of stay showed the highest proportion of surgically treated discharges. In the Middle Atlantic and Pacific areas, 36 percent and 37 percent, respectively, of all discharges involved surgical treatment. Conversely, the two regions with the greatest difference in mean length of stay between surgical and nonsurgical discharges showed the lowest percentages of surgically treated discharges. Approximately only 1 in 4 discharges involved surgery in the East South Central and West South Central regions.

### Hospital Characteristics

There was a direct, and very pronounced, relationship between the mean and median length of stay and the size of the hospital measured in adult beds (table G). The mean length of stay increased steadily with increasing bed-size from 10.6 days per discharge in hospitals with under 25 beds to 17.9 days per discharge in hospitals with 1,000-1,999 beds. The median length of stay exhibited a similar pattern. (table 4.1.8).

*Table G.—Mean length of stay for short-stay hospital discharges under hospital insurance, by adult bed size of hospital and surgical status, July-December 1966*

Bed size of hospital	Mean length of stay		
	All discharges	With surgery	Without surgery
All hospitals . . . . .	13.2	14.2	12.8
Less than 25 beds. . . . .	10.6	11.8	10.4
25-49. . . . .	11.1	12.9	10.7
50-99. . . . .	12.2	13.3	11.9
100-149. . . . .	12.7	13.7	12.2
150-199. . . . .	13.0	13.5	12.8
200-249. . . . .	13.6	13.9	13.4
250-299. . . . .	13.7	14.0	13.5
300-399. . . . .	14.0	14.5	13.7
400-499. . . . .	14.5	14.8	14.3
500-749. . . . .	15.5	15.6	15.4
750-999. . . . .	16.3	16.7	15.9
1,000-1,999. . . . .	17.9	18.3	17.7
2,000 or more . . . . .	16.4	22.3	14.4

The same relationship was apparent between bed size and length of stay for discharges with and without surgical treatment (table G). However, the overall variation in length of stay was much greater for discharges with surgery. The mean length of stay for surgically treated discharges nearly doubled from 11.8 days in hospitals with 25 or fewer beds to 22.3 days per discharge in hospitals with 2,000 or more beds. It should be noted here that larger hospitals are generally better equipped than small ones. The increase in length of stay with hospital size

probably reflects, at least in part, the fact that more persons with serious illnesses requiring specialized treatment and facilities are admitted to the larger hospitals.

Distributing discharges according to selected length of stay intervals and broad bed size categories clearly illustrates the relationship of bed size to length of stay. In hospitals with less than 100 beds nearly 1 of every 2 discharges are for stays of 7 days or less (table H). The proportion of discharges in the 7 days or less category decreases sharply as bed size increases. In hospitals with 500 or more beds only 1 in 3 discharges has a stay of 7 days or less. There is a direct relationship between bed size and the distribution of discharges as length of stay increases. In the three remaining length of stay categories, the percentage of discharges increased steadily with each increase in bed size.

*Table H.—Percentage of short-stay hospital discharges under hospital insurance, by adult bed size and length of stay intervals, July-December 1966*

Bed size	Total	Length of stay intervals				
		7 days or less	8-14 days	15-21 days	22-28 days	More than 28 days
All hospitals .	100.0	41.6	28.9	13.3	6.7	9.5
Less than 100 beds.	100.0	48.9	27.4	10.7	5.1	7.5
100-299 . . . . .	100.0	40.8	29.6	13.7	6.7	9.3
300-499 . . . . .	100.0	36.5	30.2	15.1	7.9	10.4
500 or more . . . . .	100.0	32.6	29.3	15.9	8.8	13.4

Using the same bed size and length of stay intervals, Table J shows the influence of surgery on the distribution of short-stay discharges. Fewer than 1 in 5 discharges (19 percent) with surgery occur in hospitals with less than 100 beds while more than 1 in 3 discharges without surgery (34 percent) occur in these same hospitals. Greater relative proportions of surgical discharges than nonsurgical discharges occur in each of the larger hospital bed size categories.

The distribution of discharges by selected length of stay intervals clearly demonstrates the longer hospital stays associated with surgery (table J). Nearly 45 percent of discharges without surgery involved stays of 7 days or less compared to 35 percent of surgical stays. Each of the succeeding longer length of stay intervals, however, show relatively greater percentages of surgical discharges than nonsurgical discharges.

There were variations in mean length of stay according to the accreditation status and training affiliation status of the short-stay hospital in which the stay occurred.

Table J.—Percentage of short-stay hospital discharges under hospital insurance, by adult bed size, length of stay intervals, and surgical status, July-December 1966

Surgical status and bed size	Total	Length of stay intervals				
		7 days or less	8-14 days	15-21 days	22-28 days	More than 28 days
<b>With surgery:</b>						
All hospitals . . .	100.0	34.8	31.6	15.4	7.8	10.6
Less than 100 beds . . .	18.5	7.3	6.0	2.5	1.2	1.6
100-299 . . .	44.9	16.2	14.3	6.8	3.5	4.4
300-499 . . .	23.2	7.4	7.4	3.7	2.0	2.6
500 or more . . .	13.3	3.9	4.0	2.3	1.2	2.0

500 or more . . .	8.9	3.2	2.4	1.3	.7	1.3

Under the provisions of the Medicare law, accreditation by the Joint Commission on Accreditation of Hospitals (JCAH) was deemed equivalent to meeting all conditions for participation under Medicare other than the utilization review and equal rights requirements.

Hospitals accredited by JCAH accounted for over 1.9 million, or 83 percent, of total short-stay discharges under Medicare in 1966. The mean length of stay in these hospitals was 13.5 days, slightly higher than the overall mean of 13.2 days for all discharges.

More marked differences in mean length of stay were observed when short-stay hospitals were classified according to the nature of medical training carried on in

the institution. Hospitals with comprehensive medical training programs showed considerably longer average lengths of stay. Short-stay hospitals with major affiliation to a medical school averaged 14.9 days per stay, more than a day and a half longer than the mean for all hospitals (13.2). Hospitals not affiliated with a medical school, but having an approved intern training program had average stays of 14.4 days, considerably above the national average but below hospitals with full medical school affiliation. Hospitals without medical school affiliation or intern training, but with a program for training medical residents averaged 13.3 days per stay. Somewhat surprisingly, this category of hospitals showed a longer mean length of stay for nonsurgical discharges (13.5) than for surgical discharges (13.0). However, less than 3 percent of all discharges occurred in these hospitals and reliability testing indicated that this difference was not statistically significant. The longer lengths of stay associated with hospitals with medical training programs may reflect the teaching emphasis of these institutions, as well as the fact that a greater proportion of more serious and difficult cases are referred to these institutions.

## Hospital Charges and Amounts Reimbursed

Hospital charges for short-stay hospital discharges under Medicare in 1966 totaled over \$1.3 billion, 79 percent of which was reimbursed by the program (over \$1 billion). In the hospital insurance program, the patient is responsible for payment of certain charges including the deductible amount, coinsurance payments, if applicable, and for any charges for services specifically excluded by the law. In 1966, the amount of the deductible was the first \$40 in hospital charges. Coinsurance payments were \$10 per day, applying to the 61st-90th days of hospital stay in a spell of illness. Days of care after benefits were exhausted and private duty nursing are two common examples of noncovered services for which the patient must pay. By law, Medicare reimburses hospitals for the reasonable cost of inpatient hospital services. (See "Provisions of the Law" for further information.) Reimbursement amounts shown in these tables are based on interim reimbursement rates. Available information from audited cost reports for 1966 indicates that final reimbursements are about 5 percent higher than the amounts paid on an interim basis.<sup>21</sup>

Mean hospital charges for HI beneficiaries were \$42 per day and \$559 per discharge for short-stay hospital discharges. These figures include both room and board charges and ancillary service charges. An earlier report examined short-stay hospital charge patterns under

Accreditation, affiliation, and training program	Mean length of stay			Percent of total discharges
	Total	With surgery	Without surgery	
Hospital accredited by JCAH . . .	13.5	14.2	13.1	82.9
Hospitals with major medical school affiliation . . .	14.9	15.3	14.6	20.9
Hospitals with approved intern program . . .	14.4	14.9	14.1	16.8
Hospitals with approved resident program only . . .	13.3	13.0	13.5	2.9

<sup>21</sup> See footnote 3.

Medicare between July 1, 1966, and June 30, 1967, and showed room and board and ancillary charges separately.<sup>22</sup> For stays involving surgery, mean charges were \$51 per day and \$718 per discharge; and for stays without surgical treatment, \$38 per day and \$482 per discharge.

Mean charges per day were inversely related to the length of hospital stay. Mean charges per day decreased steadily from \$51 per day for stays of 7 days or less to \$32 per day for stays of 43 days or longer (table K). As would be expected, mean charges per discharge rose steadily with increasing length of stay. Stays of 7 days or less averaged \$213 in hospital charges while stays of 43 or more days averaged \$2,082.

Mean charges per day for discharges with surgery ranged from \$60 for stays of 7 days or less to \$41 for stays with 43 or more days. Mean charges per day for nonsurgical discharges followed the same pattern but were considerably lower, averaging a high of \$48 for stays of 7 or less days to a low of \$28 for stays of 43 or more days.

Discharges of 7 days or less with surgery showed mean charges of \$263 compared to \$194 for discharges without surgery. Mean charges in both categories rose steadily with length of stay and discharges of 43 or more days averaged \$2,517 when surgery was involved and \$1,858 when no surgery was performed.

Stays of 43 or more hospital days made up less than 4 percent of all discharges but accounted for nearly 15 percent of hospital charges under hospital insurance.

The Current Medicare Survey earlier reported overall hospital charge figures of over \$1.3 billion in total, \$555 per discharge, and \$44 per day during July-December 1966.<sup>23</sup> The comparatively small differences between

those figures and the figures cited in this report are probably due mainly to sampling error.

#### Age, Race, Sex

Mean charges per day decreased steadily with increasing age (table L), from \$45 at ages 65-66 to \$37 per day at ages 85 and over. The same pattern was exhibited for discharges with or without surgery. Mean charges per day also generally decrease with increasing length of stay (table 4.1.6). The pattern of decreasing charges per day as age increases probably reflects the longer stays experienced by each successive age group. Mean charges per day were higher for men (\$44) than for women (\$41) (table L). Mean charges per day were higher for whites (\$42) than for persons of other races (\$40). These differences in mean charges per day between the sexes and races also applied to discharges with and without surgery. Lower mean charges per day for women and persons of other races may also be a reflection of their longer lengths of stay.

Mean charges per discharge followed different trends for discharges with and without surgery (table L). Mean charges per discharge with surgery rose steadily with increasing age. For discharges without surgery, mean charges per discharge rose at a slower rate up to ages 75-79 and then receded somewhat.

Mean charges per discharge were slightly higher for men (\$566) than for women (\$554). However, women showed higher mean charges than men for discharges without surgery, \$487 to \$476. Mean charges per discharge were identical for white persons and persons of other races, \$557. However, persons of other races showed higher mean charges for surgically treated discharges.

The percentage of hospital charges reimbursed by Medicare increased with age from 77 percent at ages 65-66 to 82 percent at ages 85 and over. The percentage

<sup>22</sup>See "Selected Data on Charge Patterns in Short-Stay General Hospitals under Medicare," *Health Insurance Statistics*, HI-31, U.S. Social Security Administration, Office of Research and Statistics, Sept. 30, 1971.

<sup>23</sup>See footnote 16.

Race							
White .....	42	51	38	557	713	481	78.8
Other races .....	40	47	35	557	766	464	81.2

reimbursed was slightly higher for women than for men and slightly higher for persons of other races than for white persons. Higher percentages reimbursed probably indicate that in longer stays the \$40 deductible and other nonreimbursed charges represent a smaller proportion of total hospital charges.

#### Geographic Distribution

As shown in the table below, there was a \$19 difference in mean charges per day between the geographic divisions having the highest and lowest charges.

Geographic division	Mean charges per day	Mean charges per discharge	Percent of charges reimbursed
All areas.....	\$42	\$559	78.9
United States .....	42	560	79.0
Northeast .....	47	731	75.6
New England .....	47	670	80.9
Middle Atlantic ..	47	753	74.0
North Central .....	39	532	80.6
East North Central ..	41	577	80.6
West North Central ..	35	458	80.7
South.....	37	438	77.8
South Atlantic.....	39	489	77.5
East South Central ..	36	415	76.4
West South Central ..	36	387	79.1
West .....	51	596	84.0
Mountain .....	43	509	79.1
Pacific .....	54	628	85.5

Mean charges per day were \$54 in the Pacific division compared to \$35 in the West North Central. Mean charges per discharge of \$753 in the Middle Atlantic division nearly doubled the \$387 recorded for the West South Central division. In terms of reimbursement, a high of 86 percent of hospital charges were reimbursed in the Pacific division; a low of 74 percent reimbursement occurred in the Middle Atlantic area.

#### Hospital Characteristics

Mean charges per day, mean charges per discharge, and percentage of charges reimbursed varied considerably by bed size of hospital (table M). Mean charges per day climbed steadily from \$29 per day in hospitals with less than 25 beds to \$54 per day in hospitals with 750-999 beds and dropped off in very large hospitals. A similar pattern in mean daily charges emerged for discharges with and without surgery.

As noted earlier, both mean length of stay and mean charges per day rise with increasing bed size. Mean charges per discharge, which are directly dependent on length of stay and daily charges, also increased noticeably with increasing bed size of hospital. The larger hospitals are generally better equipped and attract more difficult cases. Some indication of this can be found by examining the proportion of discharges by bed size involving surgery. Discharges with surgical treatment increased from 12 percent of the total in hospitals with 25 or less beds to 44 percent in hospitals with 1,000-1,999 beds (table 4.1.5).

*Table M.—Mean charges per day and per discharge and percent of charges reimbursed for short-stay hospital discharges under Medicare, by bed size of hospital and surgical status, July-December 1966*

Hospital bed size	Mean charges per day			Mean charges per discharge			Percent of charges reimbursed
	All discharges	With surgery	Without surgery	All discharges	With surgery	Without surgery	
All hospitals . . . . .	\$42	\$51	\$38	\$559	\$718	\$482	78.9
Less than 25 beds . . . . .	29	40	28	311	477	287	80.2
25-49 . . . . .	31	40	29	347	521	312	79.6
50-99 . . . . .	35	45	32	431	595	380	80.0
100-149 . . . . .	39	46	35	491	629	431	79.8
150-199 . . . . .	42	49	38	553	665	491	78.4
200-249 . . . . .	45	52	41	611	721	546	77.8
250-299 . . . . .	46	52	42	625	727	559	79.0
300-399 . . . . .	47	53	43	663	770	593	78.5
400-499 . . . . .	47	53	43	686	784	617	79.3
500-749 . . . . .	50	56	45	772	874	695	78.5
750-999 . . . . .	54	62	47	880	1,042	756	76.4
1,000-1,999 . . . . .	49	56	44	883	1,019	776	77.1
2,000 or more . . . . .	42	45	41	692	1,001	586	92.0

It should be noted that there were only six<sup>24</sup> short-stay hospitals with 2,000 or more beds participating in Medicare in 1966. Less than 1 percent of all 1966 short-stay Medicare discharges occurred in these hospitals. Since the data are based on a relatively small number of discharges from a few hospitals, the figures in this category are subject to greater sampling error. The following table shows mean charges and percentage of charges reimbursed by type of hospital control.

Type of hospital control	Mean charges per day	Mean charges per discharge	Percent of charges reimbursed
All hospitals . . . . .	\$42	\$559	78.9
Voluntary . . . . .	44	595	78.1
Church . . . . .	44	574	78.5
Other . . . . .	45	608	77.9
Government . . . . .	35	455	84.0
Proprietary . . . . .	44	503	76.1

Mean charges per day and per discharge were considerably lower in State and local government hospitals than in hospitals under other types of control.

### Number of Persons With One or More Discharges

The 2.3 million short-stay hospital discharges during July-December 1966 were distributed among 1,857,000

<sup>24</sup> See U.S. Social Security Administration, Office of Research and Statistics, *Medicare: Health Insurance for the Aged, 1966, Section 3.1: Participating Hospitals* (Washington, D.C.: U.S. Government Printing Office, 1970).

persons. Approximately 80 percent of persons hospitalized had one stay, 16 percent had two stays and 5 percent experienced three or more stays (table N).

*Table N.—Number and percentage of persons discharged from short-stay hospitals under hospital insurance and number of stays, July-December 1966*

Number of stays	Persons served		Discharge status			
	Number (in thousands)	Percent of total	Percent of population at risk	Total	Percent discharged alive	Percent discharged dead
All stays . . .	1,857	100.0	9.4	100.0	87.6	12.4
Persons with one stay . . .	1,480	79.7	7.5	100.0	88.6	11.4
Persons with two stays . .	293	15.8	22.3	100.0	84.6	15.4
Persons with three stays or more . . .	84	4.5	34.0	100.0	81.0	19.0

When discharges are expressed as a percentage of the population at risk it is apparent that a person who was hospitalized and discharged had a greater probability of hospital readmission in the same 6-month period than the average member of the population.

The population at risk for persons with one stay is the entire eligible Medicare population. There were an estimated 19.6 million persons eligible under Hospital Insurance during all, or part, of July-December 1966. The population at risk for two hospital discharges are persons discharged alive from their first stay. Similarly, only persons discharged alive from their second stay

were at risk for three or more stays. Under 8 percent of the eligible population experienced one stay; over 22 percent of persons discharged alive from their first stay were hospitalized again in the same 6-month period and 34 percent of persons discharged alive from their second stay experienced one or more subsequent hospitalizations.

As might be expected, the probability of survival decreased with repeated hospitalizations. The proportion of persons discharged dead increased from 11 percent for the first stay to 19 percent for three or more stays (table N).

The annual rate of persons discharged was 192 persons per 1,000 enrollees (table O). Breaking this rate into components by number of stays, 153 persons per 1,000 enrolled experienced one discharge, 30 persons per 1,000 enrolled had two discharges, and 9 persons per 1,000 enrolled had three or more discharges. The annual rate of persons with one or more discharges should be interpreted carefully. The annual rate formula, in effect, doubles six months' experience to arrive at a yearly rate. The assumption implicit in the formula is that each person discharged during a six-month period is equal to two persons discharged over a year. In fact, the data for the 6 months covered by this report indicates that a person who had been discharged once has a greater chance of readmission than a second person's chances to be admitted for the first time. Since

persons with one, two, three, etc. hospitalizations are all counted as one person served, doubling 6-months' experience probably causes some overstatement in the rate of persons served.

The annual rate of persons discharged increased steadily with age (table O). Men were discharged at a 12 percent higher rate than women, based on 205 discharges per 1,000 men and 183 discharges per 1,000 women. The annual rate of white persons discharged (197) was 46 percent higher than the rate for persons of other races (135). Similar differences were observed by sex and race in the one stay, two stays, and three or more stay categories.

Mean days of care per person with one or more hospitalizations rose steadily with increasing age (table O). This pattern was followed for persons with one stay and two stays, but mean days of care for persons with three or more stays remained fairly steady with increasing age. Mean days of care were higher for women and white persons than for men and persons of other races, respectively, in every stay category. This undoubtedly reflects the longer mean lengths of stay per discharge noted earlier for women and white persons.

The second and third hospitalizations for a person appeared to average the same length of stay as the first hospitalization. Persons with one stay averaged 13.4 days. Persons with two stays averaged 26.6 hospital days, almost exactly twice as long. Persons with three or more stays averaged 40.8 days, just over three times as

*Table O.—Number and annual rate of persons discharged, mean days of care, and mean charges for persons with one or more hospital stays under hospital insurance by age, sex, and race, July-December 1966*

long on the average (table O). This arithmetic progression of hospital days with successive stays is roughly approximated at all ages and among men, women, white persons, and persons of other races.

Mean charges per person with one or more hospitalizations rise moderately with increasing age up to ages 75-79 and then fall off slightly among the very elderly (table O). Mean charges per person are slightly higher for men than women in every stay category. For persons with one stay, mean charges per person are identical for white persons and persons of other races (\$562). Charges per person are slightly higher for whites in the two stay and three or more stay categories. Following the same pattern described for days of stay for second and third hospitalizations, a second hospital stay virtually doubled mean charges per person (\$564 to \$1,150), and three or more stays trebled mean charges per person (\$1,709).

### Hospital Charges Not Reimbursable by Medicare

Medicare patients were responsible for payment of \$122 million in 1966 for short-stay hospital services not reimbursable under Health Insurance. This amount represented over 9 percent of the \$1.3 billion total of hospital charges. Nonreimbursable charges under the program included the inpatient hospital deductible, coinsurance payments, blood deductible payments, and charges for services excluded by law. The inpatient hospital deductible was \$40 in 1966. Coinsurance

payments were \$10 per day applying to the 61st-90th days in a benefit period. Under the blood deductible provisions, the patient had to replace or pay for the first three pints of whole blood furnished in a benefit period. Some examples of charges excluded from payment by law include days of care after benefits were exhausted, the difference between private and semi-private room charges where a private room was not medically necessary, television rentals, and telephone rentals.

Persons with one or more hospital stays were responsible for an average of \$66 in nonreimbursable charges (table P). This amount increased from \$56 for persons with one stay to \$129 for persons with three or more stays. Dividing nonreimbursable charges by type, the deductible represented 66 percent, excluded services made up 29 percent, the blood deductible equalled 4 percent, and coinsurance 1 percent.

### Reliability of Estimates

Data in this report are estimates, based on discharges for a 20-percent sample of the population enrolled for hospital insurance. Instead of a fixed weighting scheme based on the sampling fraction, a ratio estimation procedure was employed to reduce overall sampling variability in the estimates. Enrollment data were utilized to provide ratios by State, sex, and age categories in the population to the same categories included in the sample. These weights were then assigned to the individual utilization records and applied uniformly in subsequent tabulations.

*Table P.—Nonreimbursed charges for discharges from short-stay hospitals under Medicare by type of charge and number of stays, July-December 1966*

Number of hospital stays	Total	Type of nonreimbursable charges

Since the data are estimated from a sample of beneficiaries, they may differ from the figures that would have been obtained if the data had been tabulated from the entire universe of beneficiaries. The amount of this sampling variability can be approximated from the standard error tables. (Estimates of sampling variability are, of course, not applicable to 100 percent data, such as the enrollment figures.) In addition to sampling variability, the results are subject to errors of reporting and processing, as in any large data collecting operation.

The standard error is primarily a measure of sampling variability—that is, of the variations that occur by chance because a sample rather than the whole universe was used. As approximated for this report, the standard errors shown do not reflect the effect of systematic biases (if any) in the data. The chances are about 68 out of 100 that an estimate from the sample would differ from the result for the entire universe, with the same methods used, by less than one standard error. The chances are about 95 out of 100 that the difference would be less than twice the standard error, and about 99 out of 100 that the difference would be less than two and one-half times the standard error.

To approximate standard errors of numbers not presented directly in tables Q through AA simple linear interpolation may be used. For example, table 4.1.1 shows an estimate of \$173,407,000 in total charges for the State of New York. Using linear interpolation in table T gives \$1,067,000 as the approximate standard error for \$173,407,000 total charges. Thus the chances are 68 out of 100 that the true total charges lies between \$172,340,000 and \$174,474,000.

To approximate standard errors of numbers not presented directly in tables Q through AA, double linear interpolation may be needed. As an illustration, Delaware shows \$659 per discharge for 4,000 discharges. Interpolating first to determine the standard error of \$659 for 1,000 discharges gives \$41.36. Similarly, interpolating for a base of 10,000 discharges gives \$13.59. The second part of the double interpolation is completed by interpolating between those derived values for the discharge base of 4,000. This yields the final estimated standard error of \$30.25 which should be rounded to \$30.00. Thus the chances are 95 out of 100 that the true charges per discharge lie between \$599 and \$719.

## Provisions of the Law

THE HEALTH INSURANCE program for the aged, commonly called Medicare, was enacted on July 30, 1965, as title XVIII of the Social Security Act, and became effective on July 1, 1966. The program, a part of the 1965 amendments (Public Law 89-97), makes available two separate but coordinated insurance coverages—hospital insurance, covering nearly all persons aged 65 and over, and supplementary medical insurance, covering those persons in this age group who enroll voluntarily and pay the premium.

### Hospital Insurance Program

The hospital insurance program (part A of Medicare) pays for a large portion of the costs of hospital and related post-hospital services. It is financed on a self-supporting basis through a tax on a portion of current earnings, paid by employees, employers, and self-employed persons. The proceeds of this tax are placed in the hospital insurance trust fund, from which reimbursements for benefits and administrative expenses incurred under the program are paid. The trust fund is reimbursed from general tax revenues for the costs of providing coverage for persons who qualify for hospital insurance but who are not eligible for monthly social security or railroad retirement benefits.

#### Benefits

The program covers the cost of covered services in a participating hospital for up to 90 days in a "benefit period" (a period beginning with the first day of hospitalization and ending 60 days after discharge from a hospital or an extended-care facility). Of the 90 days, full payment is made for the first 60 days of hospitalization after a deductible of \$40 has been paid. For each of the remaining 30 days in the benefit period, the patient pays a coinsurance amount of \$10 a day. The program provides the same benefits for services rendered in a nonparticipating hospital during a medical emergency.

Inpatient tuberculosis and psychiatric hospital services are also covered. However, there is a lifetime limit of 190 days of care in a psychiatric hospital. Where an individual is a patient in a tuberculosis or psychiatric hospital at the time he becomes entitled to hospital insurance, the number of days he was such an inpatient

in the 90-day period immediately prior to his eligibility are counted against his 90 days of entitlement in that benefit period.

Covered hospital services include hospital room and board in accommodations containing from two to four beds, nursing services except for private-duty nursing, drugs and biologicals, and all those services ordinarily furnished by a hospital to its inpatients. Coverage under the hospital insurance program does not include the services of physicians (including radiologists, anesthesiologists, pathologists, and psychiatrists) except for those services provided by interns or residents in training under approved teaching programs in a hospital.

The cost of the first three pints of blood furnished a patient during a benefit period is a deductible amount unless the patient arranges for replacement. Charges for any additional blood are covered under the program.

*Outpatient hospital diagnostic benefits.*—These benefits cover the cost of tests and related services that are ordinarily furnished by a participating hospital to its outpatients for the purpose of diagnostic study. Such services are covered subject to a \$20 deductible and 20-percent coinsurance for diagnostic services furnished the beneficiary by the same hospital during a 20-day period.

*Post-hospital home health care benefits.*—These benefits cover the cost of visiting nurse services and related home health services for as many as 100 visits in a year following the patient's discharge from a hospital or extended-care facility, provided he has been confined for at least 3 days in a hospital. A home health plan must be developed by a physician and implemented within 14 days after the patient's discharge from the hospital or extended-care facility.

### Supplementary Medical Insurance Program

The supplementary medical insurance program (part B of Medicare) provides coverage of physicians' services, additional home health services, and a variety of other health services. Individuals 65 years of age and over may enroll in the program regardless of whether they are eligible for social security retirement benefits. The insured's monthly premiums are matched by the Federal Government and paid into the supplementary medical insurance trust fund, which reimburses carriers for

benefits and administrative expenses incurred under the program.

#### Benefits

The SMI program pays for 80 percent of the allowed charges for physicians' services and other medical services after the patient has met a deductible of \$50 during a calendar year. The only dollar limit is that for treatment of mental illness outside a hospital, the maximum payment in any year, after the \$50 deductible has been met, being the lesser of \$250 or 50 percent of the allowed charges.

To preclude the possibility of having to meet a deductible twice in a short period of time, a "carryover" provision was instituted. Accordingly, covered expenses that are incurred in the last quarter of the year and counted toward the deductible in that year are also credited toward the deductible for the following year.

Covered under the program are such benefits as physicians' services, including home, hospital, and office visits; services and supplies, including drugs and biologicals that cannot be self-administered, that are furnished as a part of a physician's professional service, most commonly in his office, and either rendered without charge or included in the physician's bills; diagnostic X-ray tests, diagnostic laboratory tests, and other diagnostic tests; X-ray, radium, and radioactive isotope therapy, including materials and the services of technicians; surgical dressings, splints, casts, and other devices used for reduction of fractures and dislocations; rental of durable medical equipment, including iron lungs, oxygen tents, hospital beds, and wheelchairs used in the patient's home (including an institution used as his home); ambulance service in cases where the use of other methods of transportation is contraindicated by the individual's condition; prosthetic devices (other than dental) that replace all or part of an internal organ, including replacement of such devices; leg, arm, back, and neck braces, and artificial legs, arms, eyes, including replacement if required because of a change in the patient's physical condition; and 100 home health visits during a calendar year—these visits being independent of those provided under the hospital insurance program.

#### Eligibility

*The hospital insurance program.*—Almost all persons aged 65 and over are eligible for benefits under the hospital insurance program. Included are those persons in this age group who are entitled to monthly social security cash benefits or payments from the railroad retirement system, regardless of whether they have applied for these cash benefits. During the period under consideration, a person was eligible for hospital insurance protection even though he did not qualify for either social security cash benefits or a railroad retire-

ment annuity if (1) he had attained age 65 by July 1, 1966, (2) he would become 65 years of age before 1968, or (3) he would attain age 65 after 1967 with not less than 3 quarters of social security coverage, whenever acquired, for each calendar year elapsing after 1965 and before the year in which he would attain age 65; however, hospital insurance protection could not go into effect until the individual attained age 65. These three classes of individuals were "deemed insured" under a special transitional provision.

Federal employees who retired from the Federal service after July 1, 1960, and who had the opportunity to be covered under the Federal Employees Health Benefits Act of 1959, are ineligible for hospital insurance benefits, as are aliens with less than 5 years of continuous residence in the United States, and those persons convicted of crimes against the security of the United States.

Hospital insurance protection can be retroactive for as many as 12 months from the time an individual files his application for enrollment. For example, an individual may apply 11 months after he attains age 65 and still be entitled to benefits from the month he attained age 65.

*Supplementary medical insurance.*—Persons entitled to benefits under the hospital insurance program (part A) and retired Federal employees who are not eligible for those benefits may voluntarily participate in the SMI program.

*Enrollment.*—An eligible person may enroll during the initial enrollment period, which begins with the third month preceding the one in which an individual attains age 65 and ends 3 months later, a total period of 7 months. If he enrolls during the 3 months prior to the month in which he attains age 65, his coverage is effective with the month in which he attains age 65; if he enrolls during the month he attains age 65, his coverage begins the following month; if he enrolls in any of the 3 months after he attains age 65, his coverage begins from 2 to 3 months after enrollment, depending on how long he waited before enrolling.

A general enrollment period was set between October 1 and December 31, 1967, for those who did not enroll in the regular enrollment period, with comparable periods set to occur in every odd-numbered year. A person who enrolls during a general enrollment period may receive benefits starting on the first of July following the general enrollment period. An eligible individual must enroll within 3 years after the close of the first enrollment period in which he was entitled to enroll in order to become a beneficiary.

An initial general enrollment period was set up at the beginning of the program for people who had attained age 65 before March 1, 1966. This enrollment period began September 1, 1965, and ended on May 31, 1966, for coverage to begin with the initiation of the program on July 1, 1966.

A State may enroll otherwise eligible individuals who receive cash payments under public assistance programs if the State requests such a State-Federal enrollment agreement to be established and pays the necessary premiums.

Enrollment terminates with the beginning of the month following the month of death. In general, railroad retirement beneficiaries and individuals entitled to monthly cash social security benefits may terminate their enrollment earlier by notifying the Social Security Administration in writing during a general enrollment period of the desire to withdraw from the program. Other enrolled persons may terminate their coverage by withholding payment of premiums or by notifying the Social Security Administration in writing of the desire to withdraw from the program. An individual who previously has terminated his enrollment may re-enroll only in a general enrollment period beginning within 3 years of the date his previous enrollment had terminated. Reenrollment, however, is allowed only once.

## Financing the Program

*Hospital Insurance.*—The hospital insurance program is financed on a long-range, self-supporting basis through a separate schedule of increasing tax rates on the first \$6,600 of earnings in employment covered under the Social Security Act with the same rate for employees, employers, and self-employed persons. The earnings base will be raised in 1968 to \$7,800. This rate was 0.35 percent in 1966, 0.50 percent for 1967, and is scheduled to increase until it is 0.90 percent in 1987 and thereafter. The proceeds of this tax and that collected from the railroad retirement system are placed in a hospital insurance trust fund<sup>11</sup> from which reimbursements for all benefits and administrative expenses incurred under the hospital insurance program are paid. The hospital insurance trust fund is reimbursed from general tax revenues for the costs of providing coverage for the almost 2½ million persons who qualify for hospital insurance but who are not entitled to monthly social security or railroad retirement benefits, that is, those "deemed insured."

*Supplementary Medical Insurance.*—Premiums are paid into the Federal supplementary medical insurance trust fund<sup>12</sup> by those persons enrolled for supplementary medical insurance (or on their behalf), and a matching amount is paid from general revenues by the Federal Government.

<sup>11</sup> See *The 1966 Annual Report of the Board of Trustees of the Federal Hospital Insurance Trust Fund*, House Document No. 393, 89th Congress, 2nd Session (Washington, D.C.: U.S. Government Printing Office, 1966).

<sup>12</sup> See *The 1966 Annual Report of the Board of Trustees of the Federal Supplementary Medical Insurance Trust Fund*, House Document No. 394, 89th Congress, 2nd Session (Washington, D.C.: U.S. Government Printing Office, 1966).

The premiums of persons receiving social security cash benefits, railroad retirement, or Federal civil service annuities are deducted from their monthly benefit checks. Persons not receiving monthly benefits are billed quarterly for premiums by the Social Security Administration or Railroad Retirement Board and have a 90-day grace period in which to make payment. Premiums may be paid for as long as a year in advance, and for individuals financially unable to make quarterly payments, arrangements can be made for monthly payments.

The premium rate of the supplementary medical insurance program may be adjusted annually if medical costs rise. The law requires that the rate be set at an amount that will generate income to the fund sufficient to cover benefit payments and administrative costs incurred during the year. The monthly premium was \$3 beginning with July 1966.

States are permitted to enter into agreements with the Secretary, based on a request made before January 1, 1970, to buy in—that is, to pay the medical insurance premiums for public assistance recipients aged 65 or over who were receiving money payments under an approved public assistance plan and for all aged persons eligible to receive medical assistance under an approved Title XIX plan.

## Administration of the Program

*Hospital Insurance.*—Under the hospital insurance plan, groups or associations of providers, on behalf of their members, may nominate a national, State, or other public or private agency or organization to serve as intermediary in the claims process. A member of an association is free, however, to receive payment from an approved intermediary other than its association's nominee, if approved by the Secretary and agreeable to the intermediary selected. In addition, a provider may deal directly with the Social Security Administration.

The Secretary may enter into an agreement with a nominated organization if he finds this to be consistent with effective and efficient administration of the hospital insurance program. The intermediary makes payments to providers for covered items and services on the basis of reasonable cost determinations and assists in the application of safeguards against unnecessary utilization of covered services. The agreement may also call for (1) furnishing consultative services to assist providers to establish and maintain necessary fiscal records and otherwise qualify as providers of services, (2) serving as a center for communicating with providers, and (3) making audits of provider records. Generally speaking, the Social Security Administration utilizes the services of the hospital insurance intermediary in making payments for home health and other provider

services allowed under the supplementary medical insurance program.

Payment may be made for a beneficiary for covered emergency inpatient hospital services or covered emergency outpatient hospital diagnostic services where the hospital is not a participating facility and agrees not to charge the beneficiary for covered services. Such a hospital may be outside the United States if it is more accessible than the nearest hospital in the United States adequately equipped to treat the patient.

Requests for payment for covered services must be signed by the beneficiary (or someone for him, if he is unable to do so). Payments are made on the basis of reasonable costs for these services to participating providers of services, that is, hospitals, extended-care facilities, and home health agencies, who have been certified for participation.

In some instances, hospitals may bill for physician services rendered to inpatients. In these cases, interim payment is made from the HI trust fund. Subsequently, funds are transferred from the SMI trust fund to the HI trust fund to cover the cost of these services.

The intermediary selected by the provider reviews the claims for payment and pays the provider. Actual payment is made on the basis of an interim rate established between the provider and the intermediary. Final settlement for each provider's operating year is made on the basis of a cost report submitted by the provider, and subject to an independent audit.

No payments can be made to Federal providers of services except for emergency services, unless this provider serves as a community institution. In addition, payment cannot be made to a provider for those services it is obligated to render at public expense under Federal law or contract.

*Supplementary Medical Insurance.*—Under the medical insurance program, the Secretary of Health, Education, and Welfare may enter into contracts with carriers for the performance of specified administrative functions. The carriers' principal function is to determine whether physicians' charges are allowable (reasonable) and to make payment.

The Federal government is prohibited from exercising supervision or control over the practice of medicine, the manner in which medical services are provided, and the administration or operation of medical facilities. The patient is free to choose any qualified institution, agency, or person offering him services. The responsibility for his treatment and the control of his care remains with his physician and the hospital, facility, or agency furnishing him services. The individual may keep or obtain any other health insurance he desires.

The carrier selected by the Secretary of Health, Education, and Welfare to serve as an intermediary determines the allowed charges for bills submitted for each medical care service covered by the program and pays 80 percent of the charge.

The allowed charge for the service may be paid to the patient, or the patient may assign the bill for collection to the physician or other supplier of the service if he is willing to accept the assignment. In the former situation, the patient first pays the bill and submits the received bill to the carrier and is reimbursed, and, in the latter, the physician or other supplier submits the bill and is reimbursed. When the payment is made directly to the physician (or supplier) on assignment, the allowed charge determined by the carrier is the total charge. In both situations, the patient is responsible for the first \$50 of the charges for the services he receives during a calendar period and the amount of the bill over 80 percent of the allowed charges.

The law instructs the carrier to consider the following criteria in determining the "allowed" charge:

- (1) the customary charge for the service generally made by the physician or other person furnishing such services; and
- (2) the prevailing charge in the locality by other physicians and suppliers for similar services.

The law also specifies that the "allowed" or reasonable charge cannot be higher than the charge applicable for a similar service rendered under comparable circumstances to the carriers' own policy holders or subscribers.

Carriers also have the authority and responsibility to determine, in a given case, whether a claim is for a covered service and to deny claims for noncovered or excluded items or services. In addition, carriers are to assist in the application of safeguards against the furnishing of unnecessary services to eligible individuals.

Most services covered by the medical insurance program are rendered on a fee-for-service basis. However, services furnished under group practice prepayment plans are normally rendered in return for predetermined premium payments. In recognition of the need for special adaptation of the Medicare payment procedures for services rendered by group practice prepayment plans, the law provides that an organization which furnishes medical and other health services (or arranges for their availability) on a prepayment basis, may elect to be paid 80 percent of the reasonable cost of services in lieu of 80 percent of the allowed charge for such services.

## **General Tables**

# General Tables

## Notes

*Short-stay hospital:* General and special hospitals certified as participating facilities under Medicare and reporting average stays of less than 30 days.

*Personal characteristics:*

*Age:* Completed years at last birthday in month of admission to hospital.

*Race:* White, all other races, or race unknown as entered into the Health Insurance Entitlement (HIE) master file from basic records completed by the primary beneficiary. Race unknown, whether or not specifically indicated in a table, is included in the "all persons" or equivalent totals.

*Sex:* As designated in the HIE master file.

*Geographic classifications:* Based on the address to which the enrollee's cash benefit check is being mailed or the mailing address recorded in the HIE master file at the time the bill is processed by the Social Security Administration regardless of the reference date of the table.

*All areas:* Consists of the United States, Guam, Puerto Rico, Virgin Islands, other outlying areas, and foreign countries.

*United States:* Consists of the 50 States, the District of Columbia, and residence unknown.

*Other outlying areas:* Consists of American Samoa, the Canal Zone, Canton Island, Caroline Island, Mariana Islands, Marshall Islands, Midway Islands, and Wake Island.

*SMSA:* Standard metropolitan statistical area as classified by the Bureau of the Budget.<sup>1</sup> Except in New England, each SMSA includes a county that contains a central city of at least 50,000 inhabitants. In addition, contiguous counties are included in the SMSA if they meet certain criteria of economic and social integration with the central city. In New England, an SMSA consists of towns and cities, rather than counties. However, the mailing address of beneficiaries in the Health Insurance Eligibility file is coded only for State and county. Therefore, for New England, the SMSA was replaced by the metropolitan State economic area (SEA), which is defined in terms of whole counties.

*Hospital control:*

*Voluntary-church:* Hospitals whose governing authority is a non-profit religious organization. For "Catholic" hospitals, this organization can be either a national or international nursing order, or the local ecclesiastical authority, i.e., the local bishop.

*Voluntary-other:* Hospitals whose governing authority is a non-profit organization other than a religious one.

*Proprietary:* Hospitals whose governing authority is an individual, partnership, or profit-making corporation.

*Government:* Hospitals whose governing authority is a unit of government. The unit may be a State, county, or city, or a city and county government jointly, or a hospital district established by a State agency. Federal hospitals are excluded by law from unqualified participation in the program. Except under special circumstances, they are authorized only to furnish emergency services.

*Hospital affiliation and accreditation:*

*Accreditation by JCAH:* The Joint Commission on Accreditation of Hospitals (JCAH) evaluates hospitals for conformance to standards of accreditation. The Medicare law provides that accreditation by the Joint Commission was deemed equivalent to meeting all conditions for participation other than Title VI requirements relating to equal rights and statutory requirements for utilization review.

*Affiliation with a medical school:* A number of licensed medical schools maintain and staff component hospitals to provide the full complement of clinic training. In addition, other major hospitals have established affiliation agreements with medical schools where the hospitals have been selected by medical schools to serve as "major units" in the schools teaching programs. These two categories of hospitals are characterized as "affiliated."

*Nonaffiliated, approved intern program:* Includes nonaffiliated hospitals with intern programs approved by any one of the following: American Medical Association, American Dental Association, or the American Osteopathic Association.

<sup>1</sup> Office of Statistical Standards, Bureau of the Budget, *Standard Metropolitan Statistical Areas* (Washington, D.C.: U.S. Government Printing Office, 1967).

*Nonaffiliated, approved resident program:* Includes nonaffiliated hospitals offering approved residences in the clinical divisions of medicine, surgery, and other special fields to provide advanced training in preparation for the practice of a specialty following internship.

*Bed size:* Number of adult beds regularly available for use by inpatients. This excludes bassinets and pediatric beds.

*Surgery:* Includes any operative procedures recorded on the patient's billing form defined as surgery in the First Edition of the Current Procedural Terminology manual published by the American Medical Association. This includes procedures involving incision, excision, amputation, introduction, endoscopy, repair, destruction, suture, or manipulation.

*Discharge:* The formal release of an inpatient from a hospital. All discharges including those for persons who died during their hospitalization are included.

*Days of care:* A day during which inpatient hospital services were furnished to a person eligible for HI benefits under Medicare who was discharged during the period July 1-December 31, 1966.

*Covered day of care:* A day of care which was covered in full or in part by HI Medicare benefits. This excludes days of care prior to the start of the program on July 1, 1966, days of care prior to the person's entitlement to HI benefits, and days of care after exhaustion of benefits.

*Reimbursement:* The money amount paid to the hospital that has been determined to be the reasonable

cost for services furnished. This excludes money amounts for which the patient is responsible such as deductibles, coinsurance, and charges for noncovered services.

*Length of stay:* The number of days of care for a discharge. The day of discharge is not counted as a day of care. A hospitalization of less than one day, i.e., the patient is admitted and discharged on the same day, is counted as one day.

*Hospital charges:* The hospital's charges for room, board, and ancillary services as recorded on the billing form.

*Annual rates per 1,000 enrollees:* A ratio of the total number of discharges, days of care, or persons served multiplied by 1,000 to the number of persons entitled to benefits on October 1, 1966. Since the data in this report relate to a 6-month period (184 days) the number of events was multiplied by the fraction 365/184. The effect of the annual rate formula is to double the 6-months experience.

*Daily bed-usage rate:* The ratio of the total number of inpatient days of care used by discharged patients during the period July 1-December 31, 1966, inclusive, multiplied by 1,000, to the product of the number of days in the period and the number of persons entitled to HI benefits during this period. This is a measure of hospital utilization that shows, on the average, the number of persons out of every 1,000 HI enrollees occupying hospital beds on any given day in the period.

**Table 4.1.1 DISCHARGES BY REGION, DIVISION, AND STATE: UTILIZATION, CHARGES, AND REIMBURSEMENT FOR PATIENTS WITH SURGERY AND WITHOUT SURGERY**

(See NOTES preceding General Tables)

Area of residence	Discharges		Days of care					Hospital charges

## **Other Data Sources on the**

### **Health Insurance for the Aged Program**

The *Health Insurance Statistics* series is designed to present current, quick-release data from the Medicare Program. Two report series are issued in this format:

The *Health Insurance* (HI) series has included numerous releases since 1967. Issues released prior to 1970 are out of print, but available in many libraries.

The *Current Medicare Survey* (CMS) series is based on data from the continuing Current Medicare Survey.

Future releases in the HI and CMS series may be obtained upon request to the Publications Staff, Office of Research and Statistics, Social Security Administration, Room 1120 Universal North Building, 1875 Connecticut Avenue, N.W., Washington, D.C. 20009.

The *Social Security Bulletin*, published monthly, presents authoritative articles and analyses of medical care expenditures, prices, and utilization as well as current operating statistics from the Medicare program. The *Annual Statistical Supplement* to the *Bulletin* includes summary data on trust funds, services, claims, enrollment, average charges and participating providers of service under Medicare. The *Bulletin*, including the *Supplement*, is available in most libraries and by subscription at \$7 a year from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402

The *Research and Statistics Note* series reports on-going research, preliminary findings or provides addenda to material already published on the old-age, survivors, disability, and health insurance program. Designed to get information quickly into the hands of users, the series includes data on medical care prices, outlays, and expenditures. The series is available in many libraries. Future releases may be obtained upon request to the Publications Staff, Office of Research and Statistics, Social Security Administration, Room 1120, Universal North Building, 1875 Connecticut Avenue, N.W., Washington, D.C. 20009.
